About this Report

The Water Corporation's 2014/15 Drinking Water Quality Annual Report is a review of our performance for the financial year ending 30 June 2015.

This report is specifically designed to provide our customers and the Western Australian public with information on the quality of their drinking water.

Publication of this report allows us to meet the requirements of the Australian Drinking Water Guidelines, our [Operating Licence](#) requirements with the Economic Regulation Authority, the requirements of the [Memorandum of Understanding](#) with the Department of Health and the reporting requirements of the National Water Commission.

Acronyms

ADWG	Australian Drinking Water Guidelines	PDWSA	Public Drinking Water Source Area
AWRP	Advanced Water Recycling Plant	RO	Reverse Osmosis
CPI	Customer Performance Index	TCU	True Colour Units
CCP	Critical Control Point	TDS	Total Dissolved Solids
DOC	Dissolved organic carbon	THM	Trihalomethanes
DoH	Department of Health	UF	Ultra filtration
EDR	Electrodialysis Reversal	UV	Ultra-violet
FAC	Fluoridation of Public Water Supplies Advisory Committee	WSP	Water Safety Plan
GAWS	Goldfields and Agricultural Water Supply	WTP	Water Treatment Plant
GSTWS	Great Southern Towns Water Supply		
GWRT	Groundwater Replenishment Trial		
IWSS	Perth Integrated Water Supply Scheme		
LGSTWS	Lower Great Southern Towns Water Supply		
MIEX	Magnetic Ion Exchange		
NHMRC	National Health and Medical Research Council		
NTU	Nephelometric Turbidity Units		

Summary

Supplying safe drinking water is our highest priority. In 2014/15, we achieved outstanding compliance results for health-related characteristics and met all our health targets for drinking water quality set by the Department of Health.

Our health related performance was:

- 100 per cent compliance with microbiological guidelines
- 100 per cent compliance with health related chemical guidelines

Non-health (aesthetic) related performance:

While we strive to meet guidelines for aesthetic characteristics, this can be challenging to achieve in a State as vast as Western Australia with such diverse water sources. This is especially the case in some of our small country water schemes where there may be few sources of drinking water available and where installation of treatment can be very costly.

Although we meet all obligations under our [Operating Licence](#), we recognise there are always opportunities for improvement.

This is our 13th Drinking Water Quality Annual Report and we trust it provides our customers with the information they require about their drinking water quality. We welcome any comments and feedback by contacting us on 13 13 75 or report@watercorporation.com.au.

Wungong Dam

Our Commitment to you

We are committed to providing our customers with safe, high-quality drinking water that consistently meets the Australian Drinking Water Guidelines (ADWG), customers and other regulatory requirements.

To achieve this, we will in partnership with stakeholders and relevant agencies:

- Take a 'catchment to tap' approach to managing and protecting water quality from the source through to our customers.
- Strongly advocate source protection and primacy of drinking water quality over other land uses.
- Use a risk-based approach to identify and manage potential threats to water quality.
- Comply with the health-related criteria of the ADWG and work to progressively improve compliance with aesthetic criteria.
- Use best practice contingency planning and incident response procedures.
- Consider the needs and expectations of our customers, stakeholders, regulators and employees.
- Routinely monitor the quality of drinking water and use effective reporting mechanisms to provide relevant and timely information, and promote confidence in the water supply and its management.
- Participate in research and development activities to ensure continued understanding of drinking water quality issues and performance.
- Contribute to setting industry regulations and guidelines, and other standards relevant to public health and the water cycle.

- Continually improve our practices by assessing performance against corporate commitments and stakeholder expectations.

We will implement and maintain a management system consistent with the ADWG to protect our drinking water quality. All managers and employees involved in the supply of drinking water are responsible for understanding, implementing, maintaining and continuously improving the drinking water quality management system

Introduction

We provide drinking water to Perth, Mandurah and more than 220 regional communities throughout Western Australia.

This year we delivered 366 billion litres of drinking water from 60 dams and weirs, 94 licensed borefields, two major desalination plants (the Perth Seawater Desalination and Southern Seawater Desalination plants) and six regional desalination plants, to more than a million properties through 34,424 kilometres of water mains.

Under our [Operating Licence](#) we comply with a [Memorandum of Understanding](#) with the Department of Health. We act in accordance with the microbiological, health chemical and radiological parameters as specified by the National Health and Medical Research Council (NHMRC) in the ADWG.

Our performance (chemical, microbiological, and radiological) has this year again resulted in 100 per cent of metropolitan and country localities meeting the high standards set by the Department of Health.

An extensive and sophisticated drinking water quality monitoring program confirms the safety of the water we provide to our customers. Bacterial, chemical and radiological analyses are carried out by independent laboratories, approved by the Department of Health (DoH).

Churchman Brook Dam

Where does your water come from?

Perth Metropolitan Region

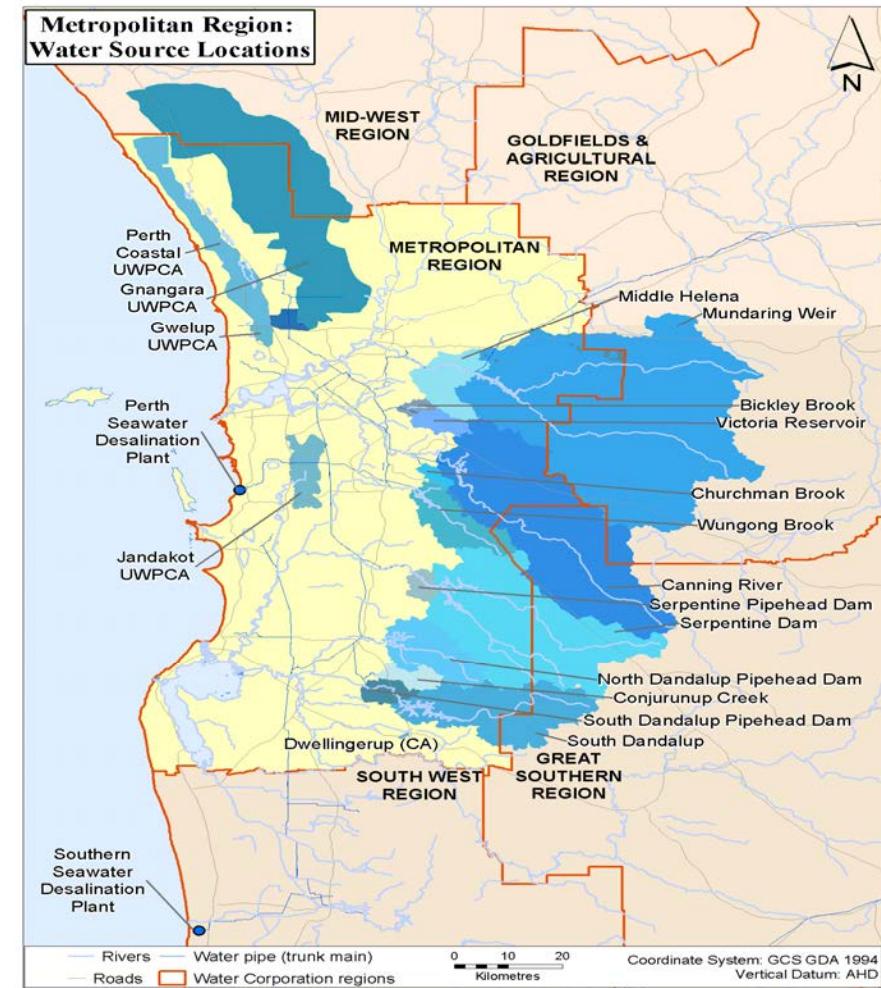

Our largest scheme, the Integrated Water Supply Scheme (IWSS) delivered more than 291 billion litres of water to more than two million customers in Perth, Mandurah the Goldfields and Agricultural Region, and parts of the South West.

Surface water comes from eight dams in the Darling Range: South and North Dandalup, Serpentine, Wungong, Churchman Brook, Canning, Victoria and Mundaring Weir. Water is also supplied from Stirling and Samson Dams in our South West Region.

Groundwater is drawn from the Yarragadee, Leederville, and Mirrabooka aquifers. Most of our 180 bores are located in Perth's northern suburbs. Groundwater is treated at six groundwater treatment plants. There are also 13 independent artesian bores which pump water directly into service reservoirs.

In 2014/15, drinking water production for the IWSS was delivered on target and within overall water allocation and licence parameters. Total groundwater abstracted was 122.1 billion litres, against an allocation of 123.8 billion litres. Water supplied consisted of 17 per cent surface water, 42 per cent groundwater and 41 per cent from desalination.

To optimise the amount of water available for the IWSS, customers may receive a mix of groundwater, surface water and desalinated seawater. The percentage of each depends on seasonal factors. Yanchep and Two Rocks are special cases in the

Where does your water come from?

Perth region, as they have their own independent groundwater supplies. It is anticipated these suburbs will eventually join the IWSS.

The Perth Seawater Desalination Plant in Kwinana exceeded its rated annual production capacity of 45 billion litres by delivering 46.4 billion litres into the IWSS. The desalinated water enters the IWSS through Thomsons Reservoir where it is blended with Jandakot groundwater and surface water. A portion can be stored in Canning Dam and Wungong Dam during periods of low demand in the winter.

The Southern Seawater Desalination Plant near Binningup produced 73 billion litres of water for the IWSS in 2014-15.

Together, these two climate independent water sources have the capacity to supply more than 40 percent of Perth's drinking water.

The Groundwater Replenishment Trial (GWRT) was formally completed on 31 December 2012 and the trial water recycling plant has continued to add 1.3 billion litres of recharge water per year into the aquifer. The GWRT plant was decommissioned in September 2014 to allow construction of the full-scale Advance Water Recycling Plant (AWRP) for the Perth Groundwater Replenishment Scheme to commence in late 2016 and will have the capacity to treat up to 14 billion litres of water per year and can be expanded to 28 billion litres as demand increases.

Serpentine Dam

Where does your water come from?

South West Region

Towns in the South West Region are supplied with water from a number of surface and groundwater sources that are largely independent. Harvey, Waroona, Hamel, Binningup, Myalup and Yarloop are supplied from the IWSS.

Margaret River is supplied by groundwater and surface water via Ten Mile Brook Dam. Quindalup, Dunsborough and Augusta are supplied by groundwater with the addition of some surface water for Augusta.

Bridgetown, Nannup, Hester, Boyup Brook, Greenbushes, Balingup and Manjimup are now connected to the Warren Blackwood Regional Water Scheme and can be supplied from a Yarragadee Bore near Nannup via the Millstream and Manjimup Dams.

Australind, Eaton, Pelican Point, Millbridge, Treendale, Kingston, Brunswick Junction, Roelands and Burekup are supplied with water sources from Leederville and Yarragadee bores, via water treatment plants in Australind, Eaton and Picton. Harris Dam supplies Collie, Allanson and Darkan as well around 35 towns in the Great Southern Region via the Great Southern Towns Water Supply Scheme.

Where does your water come from?

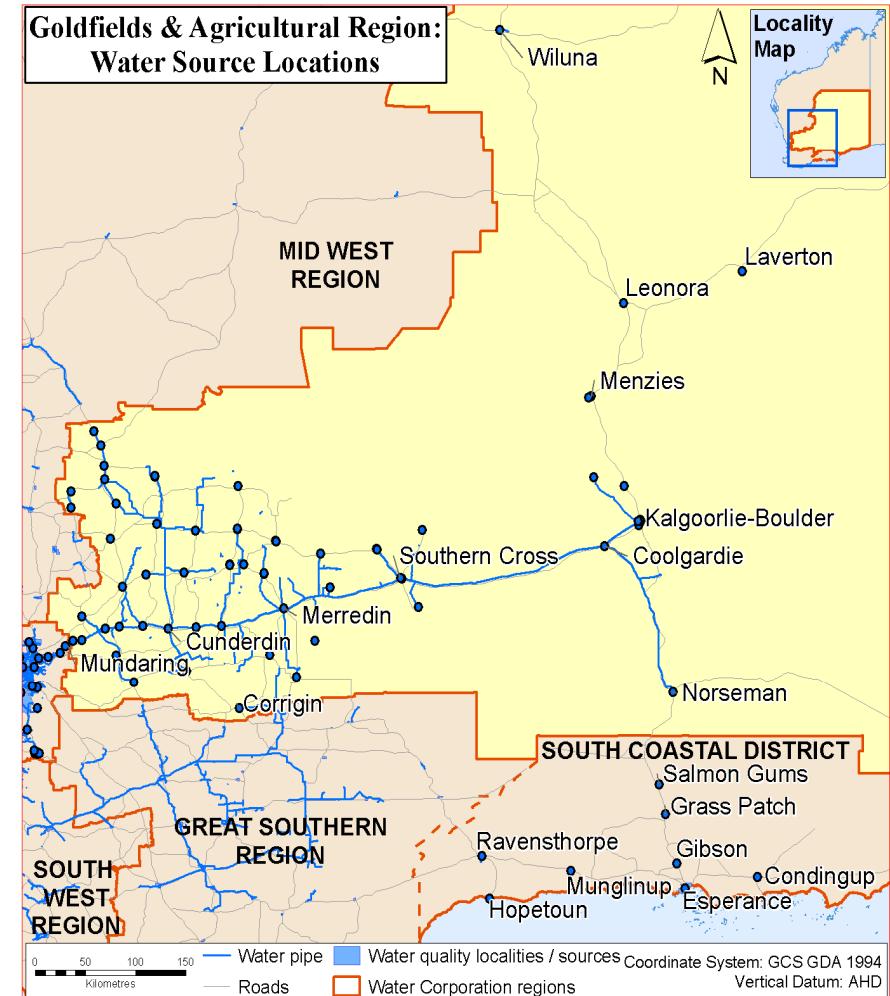

Goldfields and Agricultural Region

The Goldfields and Agricultural Water Supply (GAWS) draw its water from Mundaring Weir near Perth and supply the majority of towns in the Goldfields and Agricultural Region. The remaining towns Laverton, Leonora, Menzies and Wiluna are supplied from local groundwater sources.

Projects have been scheduled over the next few years for the construction of roofed storage tanks to replace the unroofed reservoirs on the GAWS. Additional disinfection facilities are also being installed throughout the distribution system. Both of these initiatives will improve disinfection management within the GAWS.

Mundaring Weir

Where does your water come from?

Great Southern Region

In the Great Southern Region, we have two main water supply schemes - the Great Southern Towns Water Supply Scheme (GSTWS) and the Lower Great Southern Towns Water Supply Scheme (LGSTWS). Harris Dam near Collie is the main source for the GSTWS and the South Coast borefields are the main source for the LGSTWS, although a number of towns have local sources which can contribute to the supply if required.

Hopetoun, Bremer Bay, Esperance, Condingup and Gibson are all supplied from local groundwater sources. Ravensthorpe and Salmon Gums are all supplied from local surface water sources. Grass Patch is supplied by carted water from Esperance.

Works are completed in Gnowangerup where two new tanks and an upgrade to the supply main provide for an improved scheme.

Denmark experienced its second driest year on record in 2015. In response we installed interconnecting pipework and increased treatment for the Denmark River and Quickup Dams.

The reliability and efficiency of Mount Barker's water supply was improved with the completion of a new 27km section of water main between the town and Chorkerup.

Where does your water come from?

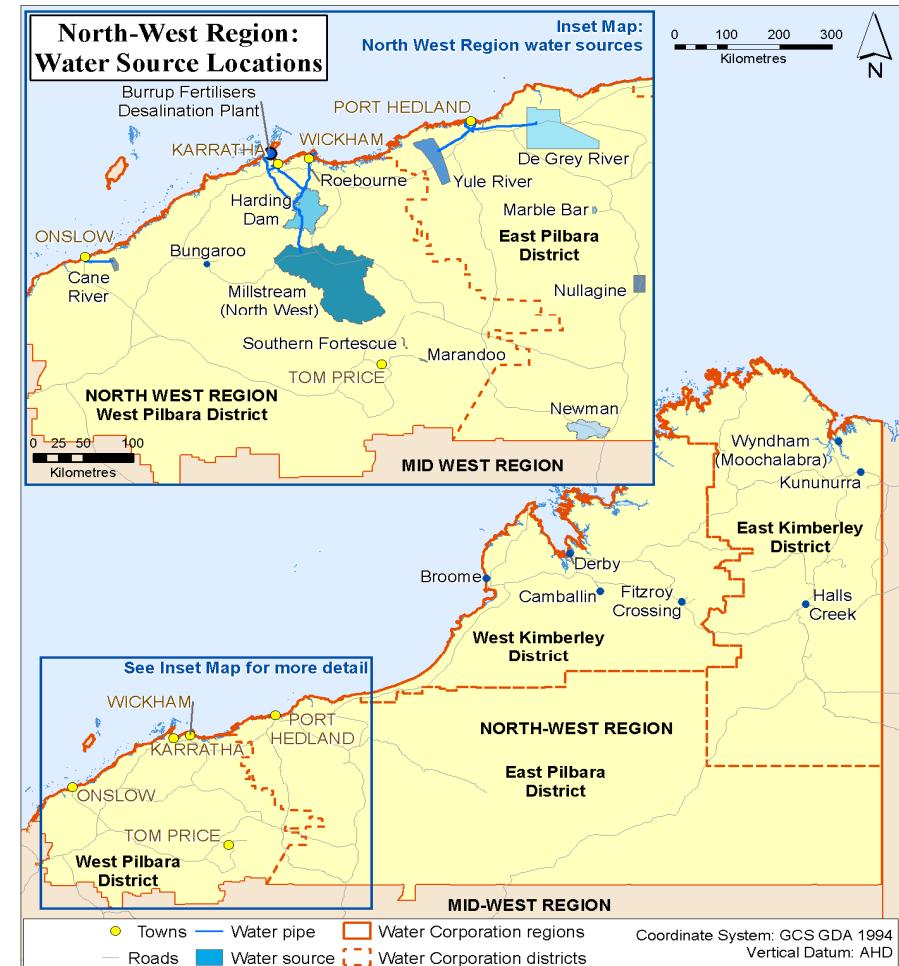

North West Region

The West Pilbara Water Supply Scheme supplies customers in Karratha, Dampier and the neighbouring towns of Roebourne, Wickham, Point Samson, Cape Lambert and the Burrup Peninsula. The scheme currently has three sources: Harding Dam, Millstream borefield and a groundwater source in the Bungaroo Valley developed by Rio Tinto Iron Ore.

The East Pilbara Water Supply Scheme supplies customers in Port Hedland, South Hedland, Wedgefield Industrial Area and the local port operations. The scheme is supplied with groundwater from the Yule and De Grey River borefields.

In the Kimberley area, the town of Kununurra is supplied by a local groundwater source. The remaining towns in the North West Region are supplied by local independent groundwater sources, with the exception of Wyndham which is supplied by Moolchalabra Dam.

The Yule and De Grey River borefield expansion to supply the Hedland scheme was complete at the end of 2014.

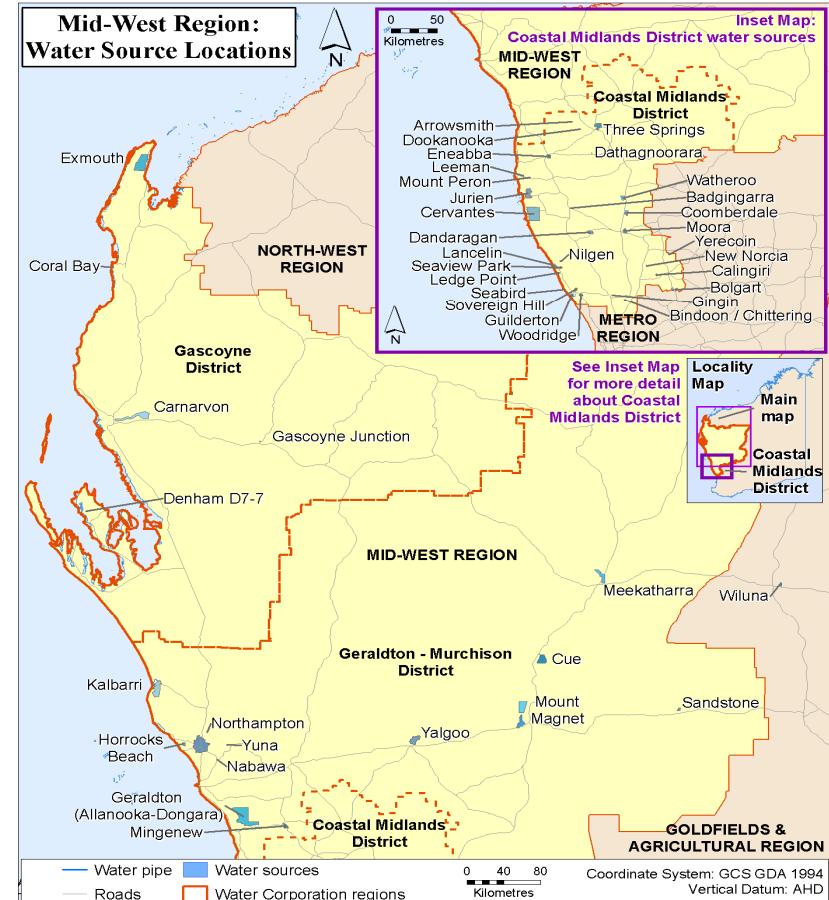

Where does your water come from?

Mid West Region

The Mid West Region, which supplies drinking water to 51 localities, uses independent groundwater sources. In a region facing challenges from scarce and brackish (moderately saline) water supplies, we are working to ensure reliable access to a quality drinking water supply for our customers.

We operate a large number of water treatment plants to manage natural characteristics of the groundwater in this region. Coral Bay, Gascoyne Junction and Denham have membrane water treatment plants while a variety of specialised filters are utilised predominantly in the coastal midlands area.

Work has been undertaken in the coastal towns of Yerecoin, Seabird, Moora, Woodridge and Bindoon on optimising the water treatment plants to improve aesthetic water quality through the removal of dissolved metals, specifically iron and manganese.

How is your water treated?

Water treatment

The specific water quality of each source dictates the type of treatment required. Where water comes from fully protected catchment areas, very little treatment is required – often just disinfection. In other cases, more intensive treatment processes may be required to ensure the drinking water delivered to every house is safe and aesthetically pleasing.

Groundwater, which is pumped from underground aquifers, can be treated to remove dissolved gases, iron, manganese, colour and turbidity. In Perth, groundwater treatment plants at Jandakot, Wanneroo, Lexia, Mirrabooka and Gwelup oxidise the water (via aeration and/or chlorination) to increase the amount of dissolved oxygen and remove both carbon dioxide and hydrogen sulphide. A coagulant (alum) is also added which increases the settling of fine particles caused by iron and natural organic matter. Clarified water then passes through sand filters to remove any remaining particles. Similar processes occur in many country water schemes. At Neerabup Water Treatment Plant, we use a treatment technology to soften the water and reduce salinity.

Naturally occurring organic substances present an issue for many water sources because they add colour to the water, which can increase taste and odour and provide precursors for disinfection by-products. Since 2001, we have used a water treatment technology known as MIEX (magnetised ion exchange) to prevent an intermittent “swampy” odour occurring in treated groundwater supplied to Perth’s northern suburbs. Unlike conventional

processes, MIEX resin more effectively removes dissolved organic carbon (DOC) from drinking water, the source of the odour and taste concerns.

The MIEX Treatment Plant has provided a considerable reduction in swampy odour contacts from customers supplied from the Wanneroo Groundwater Treatment Plant.

Perth Seawater Desalination Plant

How is your water treated?

Desalination

Desalination, using reverse osmosis (a membrane based treatment), has been used in Denham for many years to treat brackish groundwater. Reverse osmosis (RO) was the desalination process chosen for both the Perth Seawater Desalination Plant, which has been operational since November 2006, and the Southern Seawater Desalination Plant, which began supply in September 2011.

Similar technology exists at Leonora, Gascoyne Junction, Coral Bay and Hopetoun to improve the aesthetic water quality (hardness and total dissolved solids). Other methods of desalination available include Electrodialysis Reversal (EDR) which is in use at Wiluna.

Ultra-filtration

Ultra-filtration (UF) treatment is a form of membrane filtration where source water is forced through a very small semi-permeable membrane. It is designed to remove suspended solids, bacteria, viruses and other pathogens to produce water with very high purity.

UF is being used at Wyndham, Harding Dam, Pemberton, Denmark, Hyden, Walpole, Gascoyne Junction, Salmon Gums, Greenbushes and Kirup.

Disinfection

All drinking water supply schemes are disinfected with chlorine or chloramine to protect against pathogenic bacteria and viruses. The chlorine dose is maintained within a narrow range to ensure adequate disinfection is achieved with a minimal effect on the taste of our water.

Chloramination involves the use of chlorine and ammonia to produce a longer lasting disinfectant. Chloramination is used in the Goldfields and Agricultural Water Supply Scheme to maintain a disinfectant residual along the length of the extensive pipe network.

Ultraviolet (UV) light is used as an additional disinfectant in combination with chlorination at some towns where there are additional risks due to activities in the catchment.

Fluoridation

Community water fluoridation is an important, cost-effective public health measure which plays a critical role in reducing dental decay and improving oral health.

Fluoridation of community water supplies is backed by authoritative health research agencies and government bodies in Australia and worldwide, including the World Health Organization, the Australian Dental Association, the Australian Medical Association, the National Health and Medical Research Council and numerous others.

How is your water treated?

In Western Australia, fluoridation of community water supplies is regulated by the *Fluoridation of Public Water Supplies Act 1966* (the Act) which is administered by the Department of Health. The Fluoridation of Public Water Supplies Advisory Committee oversees fluoridation and makes recommendations to the Minister for Health who may issue or rescind directives as appropriate.

Water fluoridation was introduced in Western Australia in 1968. Currently, around 91 per cent of the WA population is provided with fluoridated drinking water, principally in the Perth metropolitan area and most regional centres, as well as a number of smaller communities supplied from the same source or treatment plant as the regional centres. Some regional centres in WA have naturally occurring levels of fluoride in the water supply.

The water fluoridation process involves adding fluoride in a carefully controlled manner to the recommended optimum concentration. Fluoridated water supplies (see Table 1) are sampled at least weekly to confirm acceptable fluoridation performance. Purity and quality control standards for chemicals added to drinking water are also strictly controlled by the Department of Health. Fluoridation performance is reported monthly to the Department of Health and quarterly to the Advisory Committee for Purity of Water.

Table 1 shows the localities requiring fluoridation under the Act. The fluoride levels for all individual localities are set out in the Appendices.

Wanneroo Groundwater Treatment Plant

Table 1 Localities requiring fluoridation under Fluoridation of Public Water Supplies Act 1966

Region / Scheme	Locality	Region / Scheme	Locality
Perth Integrated Water Supply Scheme	Armadale/Kelmscott Bold Park Buckland Hill Foothills Greenmount Greenmount/Darlington Hamilton Hill Harvey Hills Direct Lake Thompson Lexia Mandurah Melville Mirrabooka Mt. Eliza Mt. Hawthorn Mt. Yokine Mundaring Neerabup Pinjarra South Perth/Kewdale Tamworth Hill Wanneroo Waroona West Yokine Whitfords	Great Southern Region	Albany Esperance Katanning (GSTWS) Mt Barker Narrogin (GSTWS)
		Goldfields & Agricultural Water Supply Scheme	Kalgoorlie Merredin Northam York
		North West Region	Broome Derby Karratha
		South West Region	Collie (GSTWS) Manjimup
		Mid West Region	Exmouth Geraldton

Note: Dunsborough is de-fluoridated. (as fluoride is naturally occurring). Although the scheme is not covered by the Fluoridation Act, the recommended range and optimum concentration have been specified to provide a duty of care target (0.7-1.0mg/L and 0.9mg/L respectively)"

What drinking water guidelines must we meet?

The National Health and Medical Research Council (NHMRC) define the requirements for safe drinking water in Australia through the Australian Drinking Water Guidelines (ADWG). These Guidelines include a framework for best practice management of drinking water supplies designed to integrate all facets of the drinking water quality management and assurance system. We, along with the DoH, contribute to the rolling revision of the ADWG.

We have a [Memorandum of Understanding](#) with the DoH which requires our compliance with the microbiological, chemical health and radiological parameters as specified in the ADWG. This forms part of our [Operating Licence](#) as issued by the Economic Regulation Authority. We, along with the DoH, recognise the practices and processes used to establish and maintain high levels of drinking water quality need to be open and transparent to the community.

Operational monitoring requirements were enhanced in the 2011 ADWG. This meant moving away from just meeting drinking water quality guideline values towards a total system management, understanding risks and continuous improvement.

For aesthetic parameters, the [Memorandum of Understanding](#) states that we should comply as far as practical with the ADWG for non-health related characteristics. It is accepted full compliance with non-health related characteristics may take a number of years bearing in mind the significant investment required to achieve this. For more information on our program of water quality

improvements please refer to "Improving Your Water Quality" on page 32.

Multiple barrier approach

Preventing contamination and minimising risk is an essential part of providing our customers with safe drinking water. The ADWG emphasise the importance of using multiple barriers to ensure the safety of drinking water. Barriers include:

- Protected catchments and groundwater recharge areas;
- Large reservoirs with long water detention (storage) times;
- Water treatment (refer to "How is your water treated?" on page 15);
- Ensuring tanks and bores are sealed to prevent contamination;
- Disinfection of water; and
- Maintaining chlorine residuals through the distribution system.

We strive to continually improve the robustness and performance of our barriers.

Water Safety Plans

Having a Water Safety Plan (WSP) for each of our schemes is a large part of implementing the ADWG Framework for Management of Drinking Water Quality. WSPs use a systematic risk management approach from catchment to tap assessing the risks

What drinking water guidelines must we meet?

to each water supply scheme, ensuring appropriate preventative measures are in place, and identifying the operational controls necessary to consistently ensure the safety of drinking water. All WSPs are reviewed at least every four years, to re-evaluate the scheme's risks and update any site or treatment details. This year has seen the review of 64 schemes in the country and metropolitan region.

Source Protection

Water Corporation manages approximately 140 drinking water catchments at over 250 localities across the State. Catchment management and protection is the first barrier in providing safe, good quality drinking water to the community. Water Corporation's *Drinking Water Source Protection Policy* guides catchment operations and highlights our commitment to the primacy of drinking water quality over other catchment land uses.

Several strategies are employed by the Corporation to effectively undertake drinking water source protection. Surveillance and by-law enforcement are key elements, carried out under delegated authority from the Department of Water, to control potentially polluting activities in gazetted Public Drinking Water Source Areas (PDWSAs). In 2014/15, nearly 13,118 surveillance hours were undertaken state-wide with 204 by-law offence prosecutions initiated.

By-law enforcement has traditionally been limited to application of the *Metropolitan Water Supply, Sewerage and Drainage By-laws 1981* within metropolitan PDWSAs. In January 2013 a change in the delegation enabled application of several *Country Areas Water Supply By-laws 1957* within country PDWSAs. In April 2014 Water Corporation was given the power to prosecute for offences under the recently enacted *Water Services Act 2012* and *Water Services Regulations 2013*. Elements of this legislation may be used to improve our catchment management performance by applying the provisions relating to the protection of drinking water reservoirs and bores.

Monitoring

In accordance with the ADWG, we run an extensive drinking water quality monitoring program to confirm the safety of the water we provide to our customers. We take more than 66,000 water samples each year from water sources, treatment plants and pipe networks which supply our customers, and have in excess of 200,000 individual analyses performed by our contracted analytical laboratories.

What drinking water guidelines must we meet?

Water Corporation staff sampling water at Limestone Creek

All our water quality monitoring and reporting is coordinated through our Water Quality Management System. This software provides many aspects of water quality management and acts as the central database for all information on drinking water quality including sampling program design, sampling analysis, monitoring and reporting. The Water Quality Management System also automatically issues alerts for results outside guideline and operational limits and prompts remedial action.

Incident response

We are committed to protecting our water sources and supply schemes and have incident management plans and procedures to manage any issues with the minimum possible impact on water quality and our customers. We have measures in place to protect the level of service while ensuring your safety, including reserve storages in our tanks, carting water from other systems or having emergency treatment systems available.

We have five mobile UF plants which allow us to rapidly restore high quality drinking water supplies. In the past, the only practical option was to transport drinking water by road tankers to affected areas. Our UF plants can be mobilised quickly to provide a minimum of 500,000 litres of high quality water per day. Other treatment units, including a reverse osmosis unit, are available for specialised applications.

In addition, we conduct regular incident scenarios with the DoH to continually improve our incident management processes.

What drinking water guidelines must we meet?

Engagement with Department of Health

DoH is the regulator of drinking water quality in Western Australia. We have a [Memorandum of Understanding](#) with them for managing drinking water quality which connects all facets of nationally and internationally recognised drinking water guidelines, standards, and quality management systems. It requires us to notify the DoH within 24-hours when any sample exceeds a set health value or where any other event could pose a risk to public health. The DoH regularly reviews our monitoring results and corrective actions. The current Memorandum of Understanding provides for the DoH to conduct a performance review of our systems and databases used to manage and report drinking water quality. In consultation with the Economic Regulation Authority, the DoH commission audits to cover a three year period in line with our Operating Licence audit. For more information on the last audit, please visit the Drinking water quality section of our webpage www.watercorporation.com.au.

**Department of Health and Water Corporation at
AWRP construction site**

Case Studies

Case Study 1: Discoloured Water Events – Iron and Manganese

High concentration of iron and manganese in water supplies can cause aesthetic problems in distribution systems such as unpleasant taste, discoloured water and staining of laundry and household fixtures. Both metals are naturally occurring elements. Higher concentration of iron and manganese are most common in groundwater sources. Water infiltrating through soil and rock dissolves iron and manganese, and these minerals subsequently enter groundwater supplies.

The ADWG have set aesthetic guideline levels of 0.3 mg/L for iron and 0.1 mg/L for manganese. Notwithstanding this, the Water Corporation has set internal targets of less than 0.1 mg/L for iron and less than 0.02 mg/L for manganese on the outlet of our WTPs. These are much tighter than the National guidelines but our experience has shown that at these levels problems in distribution systems are minimised.

Our experience has also shown that at the ADWG guideline levels large quantities of iron and manganese are still sent into the distribution system. A WTP averaging 10 ML/day and producing water with an iron concentration of 0.3 mg/L, will result in more than 1000 kg of iron being sent into the distribution system each year. Over time the iron and manganese precipitates will build up in the pipework, service reservoirs, tanks and low lying areas. Discoloured water events typically occur during peak demand,

change in hydraulic conditions such as a reverse flow due to a system change, pipe bursts or hydrant flushing.

Removing iron and manganese at the WTP by operating with the Water Corporation targets rather than the higher ADWG aesthetic guideline levels is more cost effective than the increased frequency of tank cleaning and mains scouring required to manage the build-up of iron and manganese.

Bore Inspection

Case Studies

Case Study 2: Critical Control Point Monitoring – Chlorine Disinfection

The ADWG define a critical control point (CCP) as an activity, procedure or process at which control can be applied and which is essential to prevent a hazard or reduce it to an acceptable level. Every Water Corporation drinking water scheme has at least one CCP, typically associated with the disinfection barrier. The Water Corporation disinfects all water supplied to customers to provide protection against most waterborne pathogens, and a chlorine residual in the reticulation to protect against reinfection and, in many cases, Naegleria.

In accordance with the ADWG, the Water Corporation ensures that all CCPs are continuously monitored. All adverse CCP trends are reviewed to ensure that water supplied to customers is safe.

The control systems for CCPs in many treatment plants are configured to "fail safe". This means that if a critical limit is breached (or likely to be breached) the supply will be shutdown. While the water may not have been supplied to customers, this will still be investigated as it indicates a serious process failure of the CCP. If unsafe water has potentially been or could be supplied to customers (for example if the "fail safe" has not worked) this will be reported to the DoH and treated as a major incident.

Operation centre monitoring alarms

Understanding water quality test results

The following summaries are intended to assist you to interpret the results presented in this report. Additional information can be obtained by referring to the Fact Sheets contained in the [ADWG](#) published by the National Health and Medical Research Council and our website www.watercorporation.com.au.

For the purposes of this report, all data are assessed in relation to the ADWG.

Escherichia coli (E. coli)

Most human pathogenic microorganisms are found in the gut and faeces of humans and other warm blooded animals along with other non-pathogenic microorganisms. The bacteria *E. coli* is found in abundance in the intestine of warm blooded animals and, although most species are not pathogenic to humans, they indicate possible contamination by human or animal waste. As it is impractical to test for the presence of all pathogenic microorganisms in water, we test for *E. coli* to indicate the presence of contamination. If there is *E. coli* there may also be pathogenic organisms. We employ the multiple barrier approach (refer to page 20) to prevent microbial contamination, however if there is an *E. coli* detection it is immediately addressed to ensure the water supplied to customers is safe.

Thermophilic Naegleria

Thermophilic *Naegleria* refers to a group of amoebae that thrive in water between 20°C and 42°C, which includes *Naegleria fowleri*. This organism is safe to drink but can cause the disease primary

amoebic meningoencephalitis if it enters the body through the nose. It is found in the environment, is not associated with human waste and, under certain conditions, may proliferate in pipework and tanks. Adequate levels of chlorine or chloramine can control *Naegleria*. Any detection of thermophilic *Naegleria* is responded to immediately to ensure the potential risk to public health is managed.

Fluoride

Fluorine is one of the most abundant elements in the Earth's crust, and is typically found as the fluoride ion or as organic or inorganic fluorides. It is found naturally in groundwater supplies, and is present in most food and beverage products and toothpaste. Additional fluoride is added to a number of water supplies in Western Australia as directed by the Minister for Health (refer to "Fluoridation" on page 18). The fluoride concentration after dosing is set by the Fluoridation of Public Water Supplies Advisory Committee, and does not exceed 1 mg/L. Notwithstanding this, the ADWG health guideline for fluoride is 1.5 mg/L, applicable to both fluoridated and non-fluoridated localities.

Nitrate

In Western Australia, elevated nitrate concentrations are usually due to the natural process of plant decay underground that has occurred over geological time. The ADWG specify a health guideline of 11.3 mg/L (measured as nitrogen) for infants less than three months old and a guideline of 22.6 mg/L (measured as nitrogen) for adults and children over three months old. Nitrate

Understanding water quality test results

poisoning is very rare and to date no case, due to nitrate in drinking water, has been recorded in Western Australia. Where the nitrate concentration is between 11.3 and 22.6 mg/L, and there is no alternative supply, water providers may apply to the Department of Health for an exemption from the guideline.

The following localities have been granted exemption from compliance with the nitrate guidelines by the Department of Health:

- Mid West Region - Cue, Meekatharra, Mt Magnet, Nabawa, New Norcia, Sandstone, and Yalgoo.
- Goldfields and Agricultural Region - Laverton, Leonora, Menzies, and Wiluna.

In these towns, the Community Health Nurse provides advice to mothers regarding the use of alternative water for the preparation of bottle feeds. We provide bottled water free of charge via the Community Health Nurse as required.

Trihalomethanes

Trihalomethanes (THMs) are present in drinking water as a by-product of disinfection using chlorination (and chloramination to a lesser extent). We are required to comply with the ADWG health guideline of 0.25mg/L expressed as an average long term exposure. For the purposes of this report, THM compliance is assessed comparing the guideline with the mean annual THM concentration.

Alkalinity (as calcium carbonate)

Alkalinity is a measure of the parameters in water that have acid-neutralising ability, typically expressed in mg/L of equivalent calcium carbonate. Alkalinity can be affected by naturally occurring minerals or water treatment chemicals. There are no aesthetic or health considerations for alkalinity, and therefore the ADWG 2011 do not provide a guideline value.

Aluminium (acid-soluble)

Acid-soluble aluminium in water primarily originates from the addition of coagulants such as aluminium sulphate or poly-aluminium chloride in the water treatment process. These coagulants are added to aid the removal of colour and turbidity. Aluminium can accumulate in pipe sediments, and be re-suspended during periods of rapid changes to flow patterns. The ADWG specify an aesthetic guideline of 0.2 mg/L. No health guideline is set.

Chloride

Chloride is present in natural waters from the dissolution of salt deposits. In surface water, the concentration of chloride is typically less than 100 mg/L while groundwater can have higher concentrations, particularly if there is salt water intrusion. In Australian drinking water supplies chloride levels range up to 350 mg/L depending on local source characteristics.

Chloride is essential for humans and animals. It contributes to the osmotic activity of body fluids. Based on aesthetic considerations,

Understanding water quality test results

the chloride concentration in drinking water should not exceed 250 mg/L (ADWG 2011).

Hardness (as calcium carbonate)

Hard water requires more soap to obtain lather. It can also cause scale to form on hot water pipes and fittings. Hardness is caused by the presence of dissolved calcium and magnesium. Water with hardness:

- Less than 60 mg/L is soft and possibly corrosive (depends on pH, alkalinity and dissolved oxygen concentration);
- Between 60 and 200 mg/L is deemed good quality for all domestic uses;
- Between 200 and 500 mg/L will increase scale formation; and
- Greater than 500 mg/L will cause a high level scaling.

Hardness can be an important issue when purchasing appliances such as dishwashers. To convert the hardness values presented in this report to dH (German degree) units, divide by 17.8. To convert hardness to millimol (mmol) units, divide by 100 and to convert to milliequivalent (mEq) divide by 50. The ADWG specify an aesthetic hardness guideline of 200 mg/L.

Iron

Iron occurs naturally in water as a result of contact with soil or rock in the catchment. It can accumulate in pipe sediments, and be re-suspended during periods of rapid changes to flow patterns. Elevated concentrations cause discoloured water and can stain laundry. The ADWG specify an aesthetic guideline of 0.3 mg/L.

Manganese

Manganese in water can come from contact with soil or rock in the catchment. It can accumulate in pipe sediments, and be re-suspended during periods of rapid changes to flow patterns.

Elevated manganese can make water look black and stain laundry. The ADWG specify an aesthetic guideline of 0.1 mg/L.

pH

pH is a measure of water acidity (pH 7 is neutral). The ADWG specify a lower and upper aesthetic value of 6.5 and 8.5 respectively. The guidelines allow for a pH of up to 9.2 for new concrete tanks and cement-lined pipes, which can significantly increase the pH for a short period of time. Elevated pH is often caused by calcium carbonate leaching from the protective cement lining of the pipes after long transit times. This characteristic is found at a number of localities in our large water supply schemes. Where low pH is experienced, this is typically a consequence of the source characteristic rather than the influence of treatment. Buffering is a treatment process that stabilises the pH of the water.

Silica

In Australia, dissolved silica can range between 0.6 mg/L in some surface waters to 110 mg/L in ground waters. Dissolved silica can precipitate on some surfaces forming a white residue. In cases where customer complaints occur due to scale build-up, water hardness and silica concentrations are often identified as the

Understanding water quality test results

primary cause. There is no adverse health considerations associated with silica in drinking water, but to minimise scale build up on surfaces silica should not exceed 80 mg/L (ADWG 2011).

Sodium

Sodium is widespread in water due to the high solubility of sodium salts and the abundance of mineral deposits. In major Australian reticulated supplies, sodium concentrations range from 3 mg/L to 300 mg/L. While sodium is essential to human life, there is no agreed minimum daily intake level. Based on aesthetic consideration the concentration of sodium in drinking water should not exceed 180 mg/L (ADWG 2011).

Total Dissolved Solids

Total Dissolved Solids (TDS) consist of inorganic (natural) salts and small amounts of organic matter dissolved in water. TDSs comprise sodium, potassium, calcium, magnesium, chloride, sulphate, bicarbonate, carbonate, silica, organic matter, fluoride, iron, manganese, nitrate and phosphate.

Water with low TDS can taste flat, while water with high TDS tastes salty and causes scaling in pipes, fittings and household appliances. The ADWG provide guidance in the palatability of drinking water according to TDS concentration:

- 0 to 600 mg/L is good quality;
- 600 to 900 mg/L is fair quality;
- 900 to 1200 mg/L is poor quality; and
- Greater than 1200 mg/L, TDS is unpalatable.

The ADWG guideline of 600 mg/L is based on taste.

True colour

Colour in water originates mainly from natural drainage through soil and vegetation in a catchment. Corroding metal pipes can also discolour the water, with iron producing a brownish colour and copper a faint blue colour. The ADWG specify an aesthetic guideline of 15 True Colour Units (TCU). As a guide, 15 TCU is just noticeable in a glass.

Turbidity

Turbidity is the cloudy appearance of water caused by the presence of suspended matter. The ADWG specify an aesthetic guideline of 5 Nephelometric Turbidity Units (NTU) which is just noticeable in a glass of water.

Sampling parameters

Appendix A contains a list of regularly sampled parameters within functional groups and their respective guideline values.

Our Performance

Health related performance

Again we have achieved excellent microbiological performance in 2014/15 (graph 1) with 100 per cent of schemes complying with the *Escherichia coli* requirement which is the most important indicator of faecal contamination (refer to 'Understanding water quality test results on page 25).

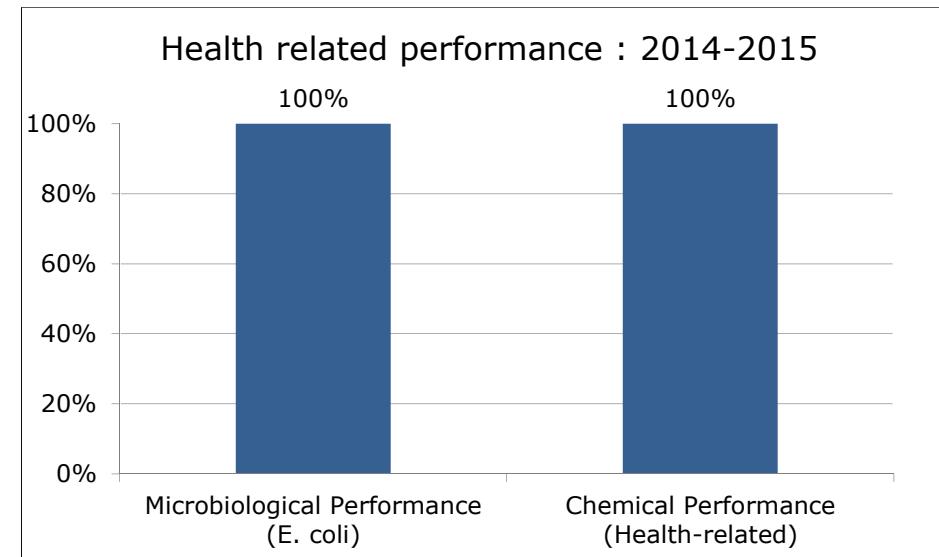

Health related chemical performance requirements of our MoU with DoH were all met for the past five years. We have also achieved 100 per cent in both microbiological and chemical health performance. For this report, the target is achieved if the yearly average concentration for each chemical is less than the guideline value.

Non-health (aesthetic) related performance

While we strive to meet the ADWG for aesthetic characteristics, this is very difficult to achieve in a state as vast as Western Australia with such diverse water sources. We are committed to improving all aspects of drinking water quality, however, improvements in aesthetic water quality can be very costly and are often hard to achieve.

Detailed performance review for 2014/15

Appendix B provides a detailed summary of test results for each scheme throughout the state. In 2014/15 there were 167 out of 251 schemes where the mean concentration for the year was less than the aesthetic guidelines. Our performance for all aesthetic analyses (alkalinity, aluminium, true colour, hardness, iron,

Graph 1: Microbiological and Chemical Health Performance

manganese, pH, TDS, turbidity, sodium, chloride and silica) across our 251 schemes was 94 per cent, with 8,557 out of 9,089 analyses complying with the aesthetic guidelines.

The results in Appendix B show a small number of excursions above the guidelines in aesthetic quality. These excursions are caused by the unique quality of local sources, lack of alternative sources, impact of the drying climate on groundwater production and abstraction from groundwater in proximity to the coast.

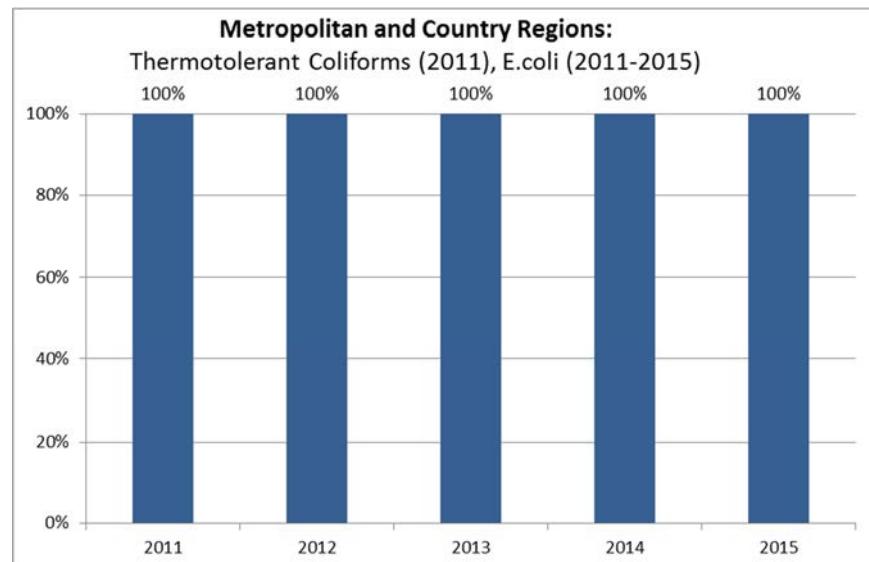

For many schemes, these excursions have no or only minimal influence on the taste of the drinking water

Our Performance

Health performance review 2011 to 2015

For the past five years, the microbiological performance has been excellent with 100 per cent of the metropolitan and country localities complying with the *Escherichia coli* (or thermotolerant coliform) and thermophilic *Naegleria* requirements.

There has been a similar high performance for chemical-health over this same period.

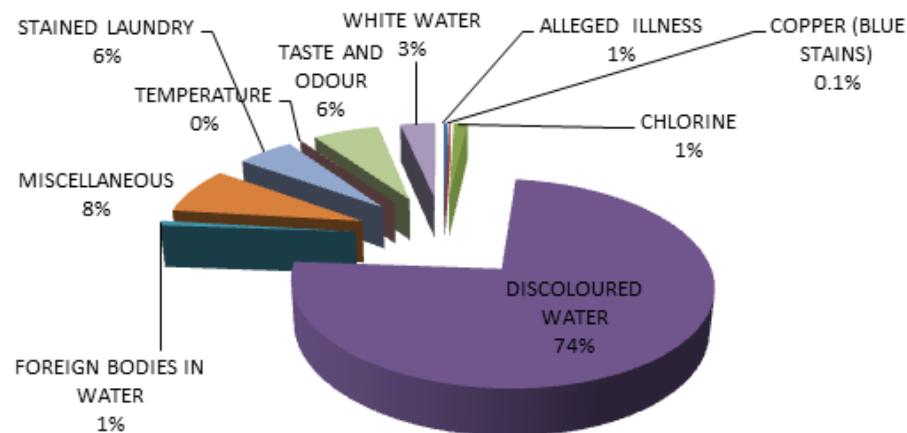

Graph 2: Five year microbiological performance

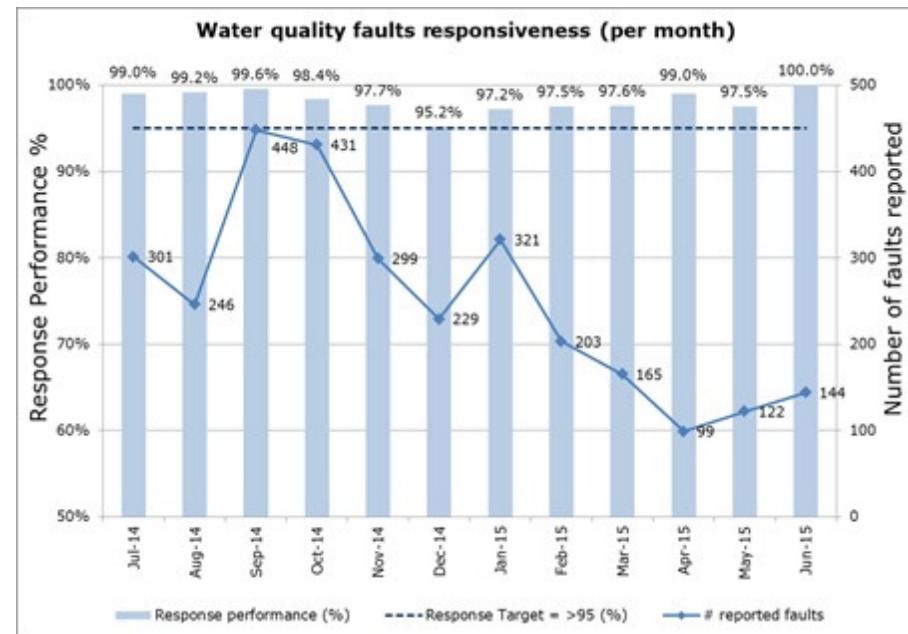

Customer Expectations

Customer contacts

Water quality related customer contacts (enquiries and complaints) are recorded and monitored continuously to identify any trends and areas for improvement. In 2014/15 our Operations Centre received 8,847 water quality related customer contacts (compared with 7,529 in 2013/14). The graph below shows the type and proportion of the water quality contacts.

Water Quality Contacts Profile 2014-15

For water quality customer contacts (water quality faults) our Customer Charter states we will respond within two hours or at an agreed time. We have an agreed customer and business target to achieve this at least 95 per cent of the time. In 2014/15 once a fault was recorded we responded to 98.2 per cent within the target of two hours (see graph above for monthly, state-wide statistics).

Customer Expectations

Customer research

We measure community perceptions of the quality of their drinking water through our quarterly Customer Performance Index (CPI) survey. In this survey, customers are asked to indicate the degree to which they either agree or disagree with two statements in relation to water quality (where 1 is 'poor' and 10 is 'excellent'). The rating for these questions, for each quarter of the year, is shown below.

Survey Questions	September 2014	December 2014	March 2015	June 2015	End of year average
How would you rate the Water Corporation on providing an acceptable standard of water quality?	7.02	7.09	7.22	7.45	7.20
How would you rate the Water Corporation on providing a consistent level of water quality?	7.15	7.21	7.31	7.21	7.22

Improving your water quality

Monitoring and reporting improvements

We continue to strengthen our operational monitoring to ensure continual barrier risk assessments. Extensive work has been undertaken on our Locality Barrier Tool project which allows continuous visibility of the critical processes during water treatment stages. Work is still in progress but has already assisted in identifying areas of progression for our capital project programs.

Water quality capital improvements

We continue an extensive program of water quality capital improvements. These projects ensure robust multiple barriers are in place from "catchment to tap" for all our schemes. Examples of work undertaken are described throughout this report.

Monitoring and control systems

Installation of instrumentation that allows continuous monitoring of key water quality parameters at each water supply ensures unsatisfactory performance is detected quickly and remedial actions initiated.

Chlorination

We continue the chlorination program upgrading all chlorinators to the latest standards. Improvements will ensure enhanced alarming, automation and reporting capability.

Water treatment

New treatment plants, and upgrades to existing plants, continue to be installed to meet the lower chemical concentrations recommended by the ADWG and to provide an additional barrier to microbiological contamination.

Towards the end of the financial year we completed upgrade of Jandakot Groundwater Treatment Plant including a new chlorination system and a new bore into the Yaragadee Aquifer. The upgrade increased the plant's treatment capacity from 40 million litres per day to 60 million litres per day.

Upgrade to Denham Water Treatment Plant increased the operation capacity of the plant by 33 per cent and ensured improved efficiency and reliability of the Denham Water Supply Scheme.

In October 2014 we completed upgrade to Margaret River's Water Supply Scheme. The upgrade has secured Margaret River's water supply during dry years providing greater capacity to service the increased demand during peak tourist periods.

Tank roofs

Construction, repair or replacement of roofs on all reservoirs and tanks ensures stored water cannot be contaminated with rainwater or pests and vermin.

Improving your water quality

Pipes and pipelines

Construction of new pipelines and modification to the flow of water through tanks and reservoirs prevents stagnation of water in storage.

We completed the new 27km section of water main between the town of Mount Barker and Chorkerup to improve the reliability and efficiency of Mount Barker's water supply.

In May 2015, we finished replacing the section of the Mundaring to Kalgoorlie Pipeline that crosses under Great Eastern Highway at Clackline.

Disinfection in long pipes

A major project is continuing to improve the persistence of chloramine through the long pipelines of the GAWS, the only chloraminated water supply system in Western Australia. One component includes monitoring the areas of nitrification, which is when natural aquatic bacteria within the pipelines convert ammonia to nitrite, one of the main causes of reductions in the extent of effective disinfection. We have been working internally, and with external research organisations to develop methods to overcome this issue. Measures that have and continue to be taken to expand the maintenance of chloramine residuals throughout the distribution system include the installation of additional chlorine and ammonia dosing plants at strategic points significantly improving the quality of GAWS water.

Appendix A – List of sampling parameters

Pesticide

Pesticide	Health Guideline Value (µg/L)
2,4,5-T (2,4,5-trichlorophenoxyacetic acid)	100
2,4-D ([2,4-dichlorophenoxy]acetic acid)	30
Aldrin + Dieldrin	0.3
Atrazine	20
Azinphos-methyl	30
Bromophos-ethyl	10
Chlordane	2
Chlorothalonil	50
Chlorpyrifos	10
Clopyralid	2000
DDT (total isomers)	9
Diazinon	4
Dicamba	100
Diclofop-methyl	5
Dieldrin	see Aldrin
Dimethoate	7
Diuron	20
Endosulfan	20
Ethion	4
Fenitrothion	7
Fluazifop [1]	10
Fluometuron	70
Glyphosate	1000
Heptachlor & heptachlor epoxide (total)	0.3
Hexachlorobenzene	Value not set
Hexazinone	400

Pesticide	Health Guideline Value (µg/L)
Lindane	10
Maldison	70
Methoxychlor	300
Metolachlor	300
Metsulfuron-methyl	40
Molinate	4
Parathion-ethyl	20
Parathion-methyl	0.7
Picloram	300
Propazine	50
Propiconazole	100
Simazine	20
Terbutryn	400
Triclopyr	20
Trifluralin	90

[1] Guideline specific to WA and set by Department of Health (WA)

Other pesticides may be assessed as indicated

µg/L = micrograms per litre

1000 µg/L = 1 milligram per litre (mg/L)

(1) Caused by mobilisation of sediment within the distribution system. (2) Elevated pH is caused by leaching of calcium carbonate from the protective cement lining of the pipes after long water transit times. This characteristic is found in a number of our localities on our large water supply schemes. Experience shows that pH at this level is not objectionable to our customers. (3) Elevated pH is characteristic of the source supplying this locality. (4) Low pH is characteristic of the source supplying this locality.
