COATING SPECIFICATION

ZINC RICH EPOXY PRIMER, EPOXY MASTIC, POLYURETHANE
TOP COATING ON STEEL OR CAST IRON

COATING SPECIFICATION: C2    ISSUE: 2    DATE: OCTOBER 2016

1.0 SCOPE

This document summarises the procedure for the application of 2 pack Zinc Rich Epoxy primer over-coated with 2 pack Epoxy mastic followed by Polyurethane top coat.

Refer Design Standard, DS 95 (Standard for the Selection, Preparation, Application, Inspection and Testing of Protective Coatings on Water Corporation Assets) for additional information or clarification.

It shall be read in conjunction with Water Corporation surface preparation specification A1 - Surface Preparation for the application of Protective Coatings on Steel or Cast Iron.

Note:
If anti-graffiti properties are required, replace the specified top coat with 2 coats of 50 microns nominal dry film thickness “Anti-graffiti Polyurethane” with a total thickness of 100 microns as described in Coating Specification J1.

2.0 PURPOSE

This is a multi-coat system for atmospheric corrosivity categories C1 to C5 as described in AS/NZS 2312. For corrosivity categories C4 & C5, Micaceous Iron Oxide (MIO) epoxy mastic is preferred [Refer product list in Appendix 4 of DS 95].

Typical Water Corporation applications include above ground clean skin Mild Steel Cement Lined (MSCL) pipe, structural steel other than that used in immersed conditions or exposed to corrosive environment such as Hydrogen Sulphide.

3.0 DEFINITIONS

ACA means Australasian Corrosion Association.

APAS means Australian Paint Approval Scheme.

Contractor means the service provider or its sub-contractor who will undertake the works.

Corporation means the Water Corporation and the Principal for the purposes of externally contracted asset delivery.

DFT means Dry Film Thickness.

ITP means the detailed Inspection and Test Plan(s) for the Works.
COATING SPECIFICATION
ZINC RICH EPOXY PRIMER, EPOXY MASTIC, POLYURETHANE
TOP COATING ON STEEL OR CAST IRON

COATING SPECIFICATION: C2       ISSUE: 2       DATE: OCTOBER 2016

NACE means National Association of Corrosion Engineers.

PCCP means Painting Contractors Certification Program.

Superintendent means the Superintendent for the contract, as defined in the conditions of contract, who is appointed by the Water Corporation to manage/oversee the work under the contract on behalf of the Water Corporation.

TDFT means Total Dry Film Thickness.

Works means the surface preparation, coating application and inspection to be undertaken by the contractor to which this coating specification applies.

4.0 SUBSTRATE PREPARATION

4.1 All visible mill scale, rust, oxides, paint and other foreign matter shall be removed from the surfaces to be coated by blast cleaning to a Class 3 (white metal) finish as specified in AS/NZS 1627 Part 4.

4.2 The blast cleaned surfaces shall have a uniform metallic appearance, a surface profile which provides satisfactory anchorage for the coating, as per paint manufacturer’s recommendation and be otherwise compatible with the coating to be applied.

4.3 Coating shall not be applied to any prepared surface(s) exhibiting “flash corrosion” or that has been abrasive blasted more than 4 hours prior to commencement of coating.

5.0 COATING MATERIALS

5.1 Where a suitable Australian Paint Approval Scheme (APAS) approved product is available it shall be used. If a suitable APAS approved product is not available, then an equivalent non-APAS approved product may be used subject to approval by the Water Corporation.

5.2 The coating components shall be thoroughly mixed in the specified proportions. Material so prepared shall be used within the “pot-life” period claimed by the manufacturer for the relevant site conditions.

5.3 Coating specifications inclusive of datasheets, coating application method statements and ITP’s shall be submitted to the Principal for approval at least 10 working days prior to commencement of work.

5.4 Surfaces to be coated which will become inaccessible after assembly or erection shall be cleaned and painted before they become inaccessible.
COATING SPECIFICATION

ZINC RICH EPOXY PRIMER, EPOXY MASTIC, POLYURETHANE
TOP COATING ON STEEL OR CAST IRON

COATING SPECIFICATION: C2   ISSUE: 2   DATE: OCTOBER 2016

5.5 Welds, edges, crevices, seams, joints and corners shall be brush coated before commencement of spray application of the coating.

5.6 Mixing, thinning, application and curing of protective coatings shall be carried out in accordance with the coating manufacturer’s recommended practice for the on-site conditions.

5.7 Recommended drying times between coats shall not be exceeded.

5.8 Applied coatings shall be protected from rain or moisture until cured.

6.0 ATMOSPHERIC CONDITIONS

6.1 Prior to and during coating application, the contractor shall record details pertaining to environmental conditions including ambient and surface temperature, relative humidity and dew point.

6.2 Coating application shall not commence if any one of the following conditions exists:

- The relative humidity is above 85%;
- The substrate temperature is less than dew point plus 3°C;
- The substrate temperature is below 10°C;
- The substrate temperature is above 55°C;
- The surface to be coated is wet or damp;
- Where the full prime coat application cannot be carried out before the specified cleanliness of the surface deteriorates;
- If the weather is deteriorating or is unfavorable for application or curing;
- If the pot life of the paint has been exceeded.

7.0 COATING THICKNESS

7.1 Coating thickness of a nominal dry film thickness of 80 microns of 2 pack Zinc Rich Epoxy primer over-coated with 150 microns of 2 pack Epoxy Mastic followed by 50 microns of Polyurethane top coat with a total thickness of 280 microns.

Caution:
Care should be exercised to avoid the application of Zinc Rich Epoxy primer of Dry Film Thicknesses in excess of 150 microns.

8.0 COATING FINISH

8.1 The finished coating shall be of uniform thickness, colour, appearance and gloss. It shall be fully cured, insoluble, adherent, coherent and free from mud cracking, holidays, laps, sags, blistering, checking, wrinkling, overspray, patchiness and any other defects that may impair the performance and/or appearance of the coating.

8.2 Protective coating colours shall comply with AS/NZS 2700 - Colour Standards for General Purposes. If a suitable approved colour is not available, then the proposed colour shall be referred to the Water Corporation for acceptance prior to use.

Reference shall be made to Water Corporation Colour Code Drawing No. EG71-1-1, Rev. E for details of colours to be used for different applications.

9.0 COATING APPLICATOR/PERSOONNEL QUALIFICATION

9.1 Work shall only be carried out by a competent person.

9.2 The work should be undertaken by a coating contractor accredited by the PCCP to a class appropriate for the work to be undertaken.

9.3 The Applicator’s Coating Supervisor shall possess as a minimum one of the following certifications:

- ACA - Corrosion Inspector; or

- NACE - CIP Level I Coating Inspector.

9.4 The coating contractor shall nominate a Coating Inspector as their Quality Control Officer to carry out inspections, submit the ITP, undertake the required testing and maintain appropriate records for all work performed.

The Applicator’s Coating Inspector shall possess as a minimum one of the following certifications:

- ACA - Coating Inspector; or

- NACE - CIP Level I Coating Inspector

10.0 INSPECTION AND TESTING OF COATING
COATING SPECIFICATION

ZINC RICH EPOXY PRIMER, EPOXY MASTIC, POLYURETHANE
TOP COATING ON STEEL OR CAST IRON

10.1 Coatings shall be visually examined for surface defects and any discontinuity arising after curing shall be recorded.

10.2 Finished coating thickness shall be determined using suitable instruments standardised (zeroed) on a smooth uncoated metal plate in accordance with AS/NZS 3894.3.

11.0 REPAIR OF A DEFECTIVE COATING AND RETESTING

11.1 Coatings with defective areas equal to 20% or more of the total coated surface will be rejected outright.

11.2 Defects such as pinholes, cracks, blisters, voids, foreign inclusions and irregular profile peaks shall be marked for repair and retested upon full cure of the repaired coating.

12.0 RECORDING AND REPORTING

12.1 Following testing a report shall be submitted by the Contractor. The Contractor shall keep detailed records and reports including the following:

- Environmental conditions (relative humidity, dew point etc.);
- Surface preparation;
- Surface profile;
- Coating application;
- Coating testing; and
- General failure

12.2 To supplement these records, prior to any works commencing, an Inspection Test Plans (ITP) shall be forwarded to the Water Corporation for review a minimum of ten working days prior to the commencement of work.

13.0 CONTRACTOR'S RESPONSIBILITY

13.1 The Contractor shall supply all necessary plant, equipment, materials and labour, prepare the surface and apply and maintain the protective coating in accordance with this specification.

13.2 A list of all items to be inspected and the relevant drawing reference shall be forwarded to the Water Corporation Coating Inspector prior to the inspection being undertaken.

13.3 The preceding inspection clauses shall not relieve the Contractor of their responsibility to supply materials and perform work in accordance with the requirements of any overriding contract documentation.
