COATING SPECIFICATION

HIGH BUILD CERAMIC FILLED EPOXY COATING ON
NEW AND EXISTING PUMPS

COATING SPECIFICATION: F3      ISSUE: 1      DATE: 12 DECEMBER 2012

1.0 SCOPE

This document summarises the procedure for the application of using 2 pack High Build Ceramic Filled Epoxy coating.

Refer Design Standard, DS 95 (Standard for the Selection, Preparation, Application, Inspection and Testing of Protective Coatings on Water Corporation Assets) for additional information or clarification.

It shall be read in conjunction with Corporation surface preparation specification A1 - Surface Preparation for the application of Protective Coatings on Steel or Cast Iron.

2.0 PURPOSE

This coating system is applied as part of a repair procedure to the internal surfaces of Cast Iron Pumps used for potable and wastewater applications. For potable water applications the coating shall also have AS/NZS 4020 (Testing of products for use in contact with drinking water) approval.

3.0 DEFINITIONS

ACA means Australasian Corrosion Association.

APAS means Australian Paint Approval Scheme.

Contractor means the service provider or its sub-contractor who will undertake the works.

Corporation means the Water Corporation and the Principal for the purposes of externally contracted asset delivery.

DFT means Dry Film Thickness.

ITP means the detailed Inspection and Test Plan(s) for the Works.

NACE means National Association of Corrosion Engineers.

PCCP means Painting Contractors Certification Program.

Spark Testing means testing of the continuity of a fully-cured coating film for evidence of defects, pin holes, holidays (misses) or damage.
COATING SPECIFICATION

HIGH BUILD CERAMIC FILLED EPOXY COATING ON NEW AND EXISTING PUMPS

COATING SPECIFICATION: F3 ISSUE: 1 DATE: 12 DECEMBER 2012

Superintendent means the Superintendent for the contract, as defined in the conditions of contract, who is appointed by the Corporation to manage/oversee the work under the contract on behalf of the Corporation.

TDFT means Total Dry Film Thickness.

Works means the surface preparation, coating application and inspection to be undertaken by the contractor to which this coating specification applies.

4.0 SURFACE PREPARATION

4.1 All visible mill scale, rust, oxides, paint and other foreign matter shall be removed from the surfaces to be coated by blast cleaning to a Class 3 (white metal) finish as specified in AS/NZS 1627 Part 4.

4.2 The blast cleaned surfaces shall have a uniform metallic appearance, a surface profile which provides satisfactory anchorage for the coating, as per paint manufacturer’s recommendation and be otherwise compatible with the coating to be applied.

4.3 Coating shall not be applied to surfaces which have become contaminated or deteriorated after blast cleaning.

4.4 Prior to blast cleaning the area to be blasted will be clearly marked and explained to the operator, all external surfaces and will be masked off to prevent damage to the external coating.

5.0 COATING MATERIALS

5.1 Where a suitable Australian Paint Approval Scheme (APAS) approved product is available it shall be used. If a suitable APAS approved product is not available, then an equivalent non-APAS approved product may be used subject to approval by the Water Corporation.

5.2 The coating components shall be thoroughly mixed in the specified proportions. Material so prepared shall be used within the “pot-life” period claimed by the manufacturer for the relevant site conditions.

5.3 Coating specifications inclusive of datasheets, coating application, method statements and ITP’s shall be submitted to the Principal for approval at least 10 working days prior to commencement of the work.

5.4 Edges, crevices, seams, joints and corners shall be brush coated before commencement of spray application of the coating.
5.5 Mixing, thinning, application and curing of protective coatings shall be carried out in accordance with the coating manufacturer’s recommended practice for the on-site conditions. Recommended drying times between coats shall not be exceeded.

6.0 ATMOSPHERIC CONDITIONS

6.1 Prior to and during coating application, the contractor shall record details pertaining to environmental conditions including ambient and surface temperature, relative humidity and dew point.

6.2 Coating application shall not commence if any one of the following conditions exists:

- The relative humidity is above 85%;
- The substrate temperature is less than dew point plus 3°C;
- The substrate temperature is below 10°C;
- The substrate temperature is above 55°C;
- The surface to be coated is wet or damp;
- Where the full prime coat application cannot be carried out before the specified cleanliness of the surface deteriorates;
- If the weather is deteriorating or is unfavorable for application or curing;
- If the pot life of the paint has been exceeded.

7.0 COATING APPLICATION – TO FILL LOCALISED PITS/CAVITATION

7.1 All pitted areas shall be repaired using Belzona® 1111 in accordance with the product data sheet.

Note: After mixing Belzona® 1111, ensure that the pits are filled out quickly to prevent the product from curing prematurely, especially in hot ambient conditions.

7.2 Using a paint brush with the bristles cut short (1 inch of bristles left) scrub into the pit the mixed Belzona® 1111 to wet it out completely.

7.3 Once wetted out apply additional material taking care to fill the pit and not just bridge over it [Refer Figure 1].
COATING SPECIFICATION

NEW AND EXISTING PUMPS

COATING SPECIFICATION: F3 ISSUE: 1 DATE: 12 DECEMBER 2012

Figure 1 - BELZONA® 1111 scrubbed into the pit to wet the surface.

7.4 Contour the Belzona® 1111 to the required shape leaving it smooth with no ridges or high spots that could protrude through the final coating [Refer Figure 2].

Figure 2 - Additional BELZON® 1111 added to fill the pit. Do not bridge it.

8.0 COATING APPLICATION – TO FILL MULTIPLE PITS/CAVITATION

8.1 For multiple pits [Refer Figure 3], the substrate preparation is the same as Section 4.0 and coating application of Belzona® 1111 procedure is the same as for isolated pits as described in Section 6.0.

Figure 3 - BELZONA® 1111 scrubbed into pits to wet the surface.

8.2 Contour the Belzona® 1111 to the required shape leaving it smooth with no ridges or high spots that could protrude through the final coating [Refer Figure 4].

9.0 COATING APPLICATION BELZONA® 1341

9.1 All subsequent coats shall be applied within the 4 hour blasting window to prevent loss of the grit blasted surface during application of the main coating.

9.2 A stripe coat of the Belzona® 1341 material is required to be applied to all welds, corners and edges.

9.3 Using a brush with the bristles cut short (1.5” inch) scrub the mixed Belzona® 1341 into the blasted surface and brush out uniformly.

9.4 During application, the material shall be visually checked for pinholes and where found these should be brushed out.

10.0 COATING THICKNESS

10.1 Internal surfaces: The internal surfaces of the pump shall be coated with two or more coats of Belzona® 1341 to achieve 550 to 800 microns dry nominal film thickness.

11.0 COATING FINISH

11.1 The finished coating shall be of uniform thickness, colour, appearance and gloss. It shall be fully cured, insoluble, adherent, coherent and free from holidays, laps, sags, blistering, checking, wrinkling, overspray, patchiness and any other defects that may impair the performance and/or appearance of the coating.

11.2 Protective coating colours shall comply with AS/NZS 2700 - Colour Standards for General Purposes. If a suitable approved colour is not available, then the proposed colour shall be referred to the Water Corporation for acceptance prior to use.

11.2.1 Reference shall be made to Water Corporation Colour Code Drawing No. EG71-1-1, Rev. E for details of colours to be used for different applications.

13.0 COATING APPLICATOR/PERSONNEL QUALIFICATION

13.1 Work shall only be carried out by a competent person.

13.2 The work shall be undertaken by a coating contractor accredited by the PCCP to a class appropriate for the work to be undertaken.

13.3 The Applicator’s Coating Supervisor shall possess as a minimum one of the following certifications:
   - ACA - Coating Inspector; or
   - NACE - CIP Level I Coating Inspector.

13.4 The coating contractor shall nominate a Coating Inspector as their Quality Control officer to carry out inspections, submit the ITP, undertake the required testing and maintain appropriate records for all work performed.

   The Applicator’s Coating Inspector shall possess as a minimum one of the following certifications:
   - ACA - Coating Inspector; or
   - NACE - CIP Level I Coating Inspector.

14.0 INSPECTION AND TESTING OF COATING

14.1 Visual Testing - Coatings shall be visually examined for surface defects and any discontinuity arising after curing shall be recorded.

14.2 Spark Testing - The finished, fully cured coating subjected to buried or immersed conditions shall be holiday tested in accordance with AS/NZS 3894.1.
COATING SPECIFICATION

HIGH BUILD CERAMIC FILLED EPOXY COATING ON NEW AND EXISTING PUMPS

COATING SPECIFICATION: F3 ISSUE: 1 DATE: 12 DECEMBER 2012

14.3 Adhesion Testing - Adhesion testing shall be carried out in accordance with AS/NZS 1580 Method 408.5 and AS/NZS 3894.9 Method C.

14.3.1 A test panel/coupon (of similar substrate material) shall be prepared and a pull off test consisting of a minimum 3 dollies, 100mm apart, shall be carried out to confirm the adhesion of the coating.

14.3.2 In the event of test failure, additional adhesion tests shall be carried out on the asset under construction.

14.3.3 The results of all adhesion tests shall be submitted to the Superintendent as part of the overall quality control documentation.

14.3.4 The results of this test shall be submitted to the Superintendent along with the ITP, other relevant product information and coating application procedures for review a minimum of 10 days prior to commencing work.

15.0 REPAIR OF A DEFECTIVE COATING AND RETESTING

15.1 Coatings with defective areas equal to 20% or more of the total coated surface will be rejected outright.

15.2 Defects such as pinholes, cracks, blisters, voids, foreign inclusions and irregular profile peaks shall be marked for repair and retested upon full cure of the repaired coating.

16.0 RECORDING AND REPORTING

16.1 Following testing a report shall be submitted by the Contractor. The Contractor shall keep detailed records and reports including the following:

- Environmental conditions (relative humidity, dew point etc.);
- Surface preparation;
- Surface profile;
- Coating application;
- Coating testing; and
- General failure.

16.2 To supplement these records, prior to any works commencing, an Inspection Test Plan (ITP) shall be forwarded to the Water Corporation for review a minimum of ten working days prior to the commencement of work.

COATING SPECIFICATION: F3      ISSUE: 1      DATE: 12 DECEMBER 2012

17.0 CONTRACTOR’S RESPONSIBILITY

17.1 The Contractor shall supply all necessary plant, equipment, materials and labour, prepare the surface and apply and maintain the protective coating in accordance with this specification.

17.2 The preceding inspection clauses shall not relieve the Contractor of their responsibility to supply materials and perform work in accordance with the requirements of any overriding contract documentation.
